

FINAL POST-AUDIT CORRECTIONS

Web UI/UX Design Correction & Completion Handover

Required corrections after the end-to-end review of the updated marketing website and full-platform prototype

Prepared for	UI/UX Designer
Document owner	ShriNeo Vittiyaam Private Limited - Product & Design
Version / date	v1.1 / 13 August 2026
Status	Urgent correction cycle - complete, self-review and resubmit
PURPOSE Complete the pending corrections carefully and as quickly as practical, without disturbing approved areas. After every update, re-check the complete platform yourself before sharing it back for review.	

1. How to Use This Handover

- Treat every item marked Must Fix as required for the next review build.
- Retain approved screens and content unless a change is explicitly listed here.
- Update existing screens and create missing states/actions; do not redesign the product from scratch.
- Build connected journeys, not isolated static screens. One action must update all relevant panels and timelines.
- Use the separate Loan Application Flow & Steps document as the only source for product-, occupation-, field- and document-level application logic.
- Work efficiently, but do not skip interaction states, responsive frames, content checks or self-QA for speed.

DELIVERY RULE Do not return the file immediately after visual changes. First complete the correction checklist, click through every major journey, verify all four panels, and confirm that no approved screen has regressed.

2. Current Audit Verdict

The updated prototype is a strong structural improvement, but it is not ready for final design approval. Core modules exist; several cross-panel workflows, lifecycle states, loan-specific rules and operational detail actions remain incomplete or disconnected.

Area	Audit status	Instruction
Approved homepage direction	Retain	Do not redesign locked homepage content or visual structure.
Core platform/module coverage	Partially complete	Retain the current shell and complete the missing actions, states and connected workflows.
Cross-panel lifecycle	Not complete	Connect lender, borrower, agent and admin states using one canonical application record.
Responsive/state prototypes	Not complete	Create real viewport frames and materially different journey states.

3. Locked Direction - Retain Without Redesign

- Homepage/marketing-page visual direction, overall layout and approved content structure.
- Current LSP wording and current lender names.
- The existing "Guaranteed commissions" wording.
- The existing "Over 400 million" claim.
- Homepage borrower-fee and legal messaging.
- Existing portal visual language, role-specific navigation concept, consent-gate pattern, PII masking/audit pattern and prototype-data disclosure.
- Footer correction: the empty "CIN:" line has been removed and must remain removed.
- New-borrower empty dashboard, separate CIBIL Score and SNV Trust Score modules, all five products, the 10-step application shell, agent matching/reassignment, Secure Agent Chat, Masked Call, agent training and lender clarification/rejection controls.

4. Immediate Global Corrections

4.1 Neo greeting and launcher

- Show the marketing-page greeting approximately 1 second after the page becomes usable. The current clean-session delay is approximately 2 seconds and is inconsistent across sessions.
- Fix the close control so one click always dismisses the greeting. Keep the effective target approximately 40-44 px and above all overlapping layers.
- Remember dismissal for the current browser session; do not reopen the greeting on internal navigation.
- Retain the current lower/right greeting position and compact launcher position.
- Do not open the greeting preview over authentication, application steps, portal pages, Secure Agent Chat, Masked Call or other critical dialogs. The compact launcher may remain available.
- Verify keyboard focus, Escape-to-close, focus restoration and the close button's accessible name.

4.2 Language controls

- Remove the Preferred Language dropdown from sign-up. Retain the single global language toggle.

- Remove any other duplicate interface-language selector. If a journey genuinely needs a service/communication preference, label it Preferred Communication Language so it is not confused with the global UI toggle.

4.3 Persistent branding

- Use a proper ShriNeo logo/wordmark at the top of every route: marketing, authentication, onboarding, application steps, borrower, agent, lender, admin, prototype navigator, restricted/empty/error and In development screens.
- Desktop: persistent sidebar/header logo. Tablet/mobile: compact sticky header logo.
- A persistent app-shell logo is sufficient; do not repeat the logo inside every content card.

4.4 Prototype Navigator and responsive frames

- Change Application - 5 steps to Application - 10 steps.
- Desktop, tablet and mobile preview controls must open actual frames/viewport variants, not the same route at the same size.
- Retain the development-only disclosure and illustrative-data label.

5. Borrower Experience - Must Fix

5.1 Connect the Action Centre end to end

The lender can currently create a clarification request and receives a message that it was pushed to the borrower, but the borrower Action Centre still shows "You're all caught up". This contradiction must be removed.

- Every lender request must create the same task in the borrower Action Centre and relevant Application Detail.
- Show application/file ID, lender, request ID, required item, borrower-facing reason, request date, due date, accepted formats, recipient visibility and current status.
- Actions: provide details, camera capture, upload, select from Document Vault, ask a question, save draft, review and submit.
- Statuses: New -> Opened -> Draft -> Submitted -> Received -> Under review -> Accepted / Re-upload requested / Closed.
- After submission, show receipt timestamp/reference and update lender history, consented agent workspace and admin audit.

5.2 Make every lifecycle scenario materially different

- Restricted, Suspended and Archived must have different permissions, explanation, actions and recovery path.
- Draft, Submitted, Documents Required, Lender Review, Manual Review, Approved, Disbursal Initiated, Disbursed, Rejected and Closed must each change the page content, timeline and available actions.

- Never keep In review content below Rejected, Closed, Approved or Disbursed banners.
- Connect dashboard, applications, documents, Action Centre, CIBIL and SNV states to the same selected scenario.

5.3 Correct loan-product and occupation logic

- Retain both Salaried and Self-Employed branches where applicable.
- Business Loan must primarily expose business/professional profiles. Salaried income may be captured only as secondary/co-applicant income where applicable; do not treat a salaried-only profile as the standard Business Loan path.
- Home Loan subtypes must be Ready Property Purchase, Self-Construction and Plot Purchase + Construction.
- Remove Home Renovation / Extension from the generic Home Loan branch.
- Mortgage/LAP must expose Repair & Renovation and Home Equity / Loan Against Property as finalized in the separate application-flow specification.
- Create complete co-applicant profile, relationship, ownership, income/KYC/document and consent branches where required; a relation dropdown alone is not sufficient.
- Every field/document must be marked Mandatory, Recommended, Optional or Conditionally Mandatory, with the condition stated.
- KYC must clearly provide DigiLocker, Camera Capture and File Upload. Bank statements must provide Account Aggregator and PDF Upload. Other documents must provide Camera Capture and Upload.
- Create CIBIL and SNV states for not checked, consent required, current, stale/refresh required, unavailable/failed and insufficient-data conditions, including recipient-specific sharing consent.
- Re-test every product x occupation combination so documents do not leak across branches. Example: Sachet Loan must not inherit two-year ITR/GST requirements unless the selected profile and lender rule actually require them.

COMPANION DOCUMENT The separate Loan Application Flow & Steps document governs the exact steps, fields, documents and conditional rules. Do not simplify, improvise or replace it with this correction note.

5.4 Complete supporting borrower flows

- Show all five loan shortcuts or provide a clear View all 5 loans action on the dashboard.
- Find Agent request must include application/file, product, amount band, help needed, language, PIN/service area, preferred contact time and limited-data-sharing consent.
- Assigned agent profile must show Verified by ShriNeo, agent ID, training status, service area, languages, availability and application/file scope.
- Secure Agent Chat must include Document Vault sharing, progress/retry/status, report/block and end-assistance actions, plus the permanent password/PIN/CVV/OTP warning.
- Move masked-call simulation controls out of the borrower-facing modal and into Prototype Navigator/QA controls.

6. Agent Experience - Must Fix

Design the complete gated onboarding sequence and connect it to operational access:

1. Contact verification.
 2. Profile and service-area setup.
 3. KYC and liveness verification.
 4. Agreement, code of conduct and consent acknowledgements.
 5. Bank details with Skip for now.
 6. Training video, assessment and policy acknowledgement.
 7. Admin review.
 8. Training certificate and Verified by ShriNeo badge.
 9. Welcome screen and dashboard unlock.
- If bank details are skipped, dashboard access may continue after mandatory approval, but commissions/payouts remain locked with a persistent Complete payout setup banner.
 - Before accepting a nearby request, hide borrower identity completely. Use anonymous request ID plus product, amount band, help, language, service area and request age.
 - Design first-valid-accept lock, already-assigned conflict, decline and expiry states.
 - Make Leads and My Files rows actionable with Open Workspace, follow-up, documents, status and escalation controls.
 - Create an Assigned Borrower Workspace containing consent, Secure Agent Chat, masked call, checklist, lender requests, documents, timeline, drafts and borrower-approval checkpoints.
 - Use Rajasthan, Uttar Pradesh, Gujarat and Delhi/NCR examples consistently. Remove Indore, Dewas, Ujjain and other MP-only examples.

7. Lender and Admin Experience - Must Fix

7.1 Lender

- Retain the current workbench, KFS, masking/audit and human-review direction.
- Make dashboard and manual-review queues openable using contextual Open Application/Open Case actions.
- Create a complete Application Detail covering profile, income, requirement, loan-specific data, documents, consents, CIBIL, SNV, requests, decisions, offers and activity.
- Additional-information requests must support field/document, borrower-facing reason, due date, private internal notes, send/receive and accept/reject/re-request states.
- Approval, decline and escalation controls must use confirmation safeguards; decline requires a reason code and borrower-facing explanation.
- Complete product/eligibility/routing/limit configuration, team/RBAC, billing, reports, API/webhook retry and incident workflows.

7.2 Admin

- Every Borrower, Agent, Lender, Loan and Fraud table row needs Open/View and the relevant detail workflow.
- Agent actions: KYC review/re-request, assessment status, approve, issue badge/certificate, suspend, reinstate and investigate.
- Lender actions: onboarding, integration, product/routing/limit configuration, team permissions, activate/suspend and incident coordination.
- Loan/Fraud actions: complete timeline, evidence, assign, investigate, intervene/escalate, notify lender and close with rationale.
- CMS must support create, edit, preview, approve and publish. Reports need scheduling/history. Consent records need actions and audit trail.
- Remove the statement that Sachet loans are enabled for prototype journeys only. The design must remain stage-agnostic.

8. Shared Consistency, Content and Accessibility

- Use one canonical seed-data source across all four panels: borrower, application ID, product, amount, tenure, lender, score, status, dates and timeline must reconcile.
- Fix duplicated currency symbols such as INR/rupee symbol appearing twice.
- Render emphasis normally; do not display literal Markdown such as ****Safety Warning****.
- Replace placeholder phone numbers and internal legal/support/grievance details before developer handoff.
- Replace generic repeated actions with contextual accessible names: View [lender] KFS, Download PAN, Open application [ID], Upload bank statement.
- Correct spelling/grammar including Outstanding and hard enquiry footprints, and recheck all helper text and disclaimers.
- Use coherent prototype dates/document periods; do not show expired next actions without an overdue state.
- Use one H1, logical focus order, Skip to main content, visible focus, approximately 44 px touch targets and complete loading/disabled/success/error states.
- Replace the generic In development modal with a branded unavailable/not-found state containing the logo and a useful recovery action.
- Route regulatory and grievance wording through final legal/compliance review without changing locked homepage messaging.

9. Mandatory Designer Self-QA Before Resubmission

After completing all updates, personally re-check the complete design. Do not rely only on file names, component changes or the fact that a screen exists.

- ☐ Open both the marketing website and Prototype Navigator from a clean session.

- ☐ Confirm Neo appears at approximately 1 second, closes in one click, stays dismissed and does not cover critical workflows.
- ☐ Confirm there is one language control on sign-up and a persistent proper logo on every route and breakpoint.
- ☐ Click every Prototype Navigator scenario and verify that the page content, permissions, timeline and actions actually change.
- ☐ Open real desktop, tablet and mobile frames and check overflow, wrapping, navigation, modal placement and touch targets.
- ☐ Run one borrower file end to end: new account -> application -> KYC -> scores -> lender matching -> request -> Action Centre response -> offer/KFS -> decision -> disbursal/servicing.
- ☐ Verify the same file in borrower, consented agent, lender and admin panels after each cross-panel action.
- ☐ Run every loan product and all applicable salaried/self-employed/professional branches against the separate Loan Application Flow & Steps document.
- ☐ Complete agent onboarding once with bank details and once with Skip for now; verify access, payout lock, certificate and badge rules.
- ☐ Open every major table row and test the primary lender/admin actions, empty states, confirmations, errors and recovery paths.
- ☐ Search globally for placeholder numbers, duplicate currency symbols, literal Markdown, MP-only examples, stale dates, generic buttons, Phase/Coming soon/prototype-only wording and contradictory IDs/statuses.
- ☐ Confirm that locked homepage content and approved visual direction were not unintentionally changed.

RESUBMISSION REQUIREMENT Share the updated prototype only after every checklist item has been re-tested. Include a short completion note listing corrected items, any deliberately retained items and any remaining blocker. Do not mark a connected workflow complete if only one side of it has been designed.

10. Final Instruction

Please complete these corrections urgently, efficiently and carefully. Preserve approved work, resolve all listed gaps, connect the platform journeys across roles, and perform a complete self-review before returning the design. The objective is to finish and stabilize the existing full-platform design - not to start another redesign cycle.
