

FINAL DESIGN DIRECTION

Stage-Agnostic Web UI/UX Design Handover

Final requirements for completing and updating the Borrower, Agent, Lender and Admin experiences

Prepared for: UI/UX Design Team

Document owner: ShriNeo Vittiyaam Private Limited - Product & Design

Version / date: v1.0 / 12 August 2026

Status: Approved direction for design completion and developer handoff

PURPOSE Complete the existing prototype, create every missing journey and state, and retain the approved visual direction. This is a full-platform design brief, not a release plan.

1. How to Use This Handover

- Preserve approved screens and content unless this document explicitly requires a change.
- Update existing screens where a correction is specified.
- Create missing pages, detail views, actions and system states described below.
- Design responsive desktop, tablet and mobile versions with interaction notes and complete content.
- Mark external services as system dependencies, never as future phases.

SEPARATE COMPANION DOCUMENT The detailed Loan Application Flow & Steps specification will be shared separately. It governs the field-level, document-level, employment-branch and product-specific application flow. Do not duplicate, shorten or improvise that flow in this document.

2. Locked Direction - Preserve vs. Update

2.1 Preserve without redesign

- Homepage and marketing-page visual direction, layout and content structure.
- Current LSP wording and current lender names.
- The existing "Guaranteed commissions" wording.
- The existing "Over 400 million" claim.
- Homepage borrower-fee and legal messaging.

- Portal visual system: information hierarchy, sidebar pattern, status chips, consent-gate concept, neutral offer comparison, PII masking/audit pattern and desktop design direction.
- Prototype/internal-data disclosure and the role-specific navigation concept.

2.2 Required homepage updates

- **Remove the empty "CIN:" line** from the footer.
- Show the Neo greeting approximately 1 second after page load.
- Move only the Neo greeting slightly further right and lower. Keep the compact Neo launcher position unchanged.
- Fix the greeting close control: keep it above the content layer, reserve clear space around it and use a 40-44 px target.
- Remember dismissal for the session so the greeting does not reopen on every internal navigation.

2.3 Internal-page updates

- Replace placeholder legal, support, grievance and contact details before final developer handoff. This applies to internal/legal pages, not the homepage.
- Apply all approved loan-page, UX, accessibility and content corrections in this handover and the separate loan-flow specification.
- Where borrower-fee wording needs clarification inside a portal, use the approved internal wording without changing the homepage.

3. Stage-Agnostic Product Mandate

- Design the complete platform vision for Home, Mortgage/LAP, Personal, Business and Nano/Sachet loans.
- Do not use "Phase 1", "Phase 2", "Post-MVP", "Coming soon" or similar roadmap labels in user-facing designs.
- Runtime states remain valid: no matching lender, unsupported bank, permission restricted, service unavailable, eligibility not met or integration failed.
- Cover the full lifecycle: sign-up, onboarding, application, KYC, score checks, lender matching, lender requests, offers/KFS, sanction, e-Sign/e-Mandate, disbursal, repayment, closure, grievance and account management.
- Every important screen needs default, new/empty, loading, partial, action-required, success, failed, offline/stale, restricted and role-specific states.
- Use progressive disclosure and conditional content. Full-platform coverage does not mean displaying every field or action at once.

PROTOTYPE RULE The navigator may expose multiple test scenarios, but the actual sign-up journey must open the correct new-user state. Mock data is permitted only in explicitly labelled prototype scenarios.

4. Borrower Experience

4.1 Final borrower navigation

Use the following primary structure. Contextual detail screens may open within these modules.

- Dashboard
- Apply for a Loan
- My Applications
- Action Centre
- My Loans
- Payments
- Documents
- CIBIL Score
- SNV Trust Score
- Find a Loan Agent
- Messages
- Notifications
- Support
- Profile

4.2 New borrower and dashboard lifecycle

1. Verify mobile number through OTP.
 2. Select language and create the basic account.
 3. Open an empty first-time dashboard.
 4. Let the borrower start an application, check scores, find an agent or explore products.
- Do not show a pre-filled EMI, outstanding principal, application, loan, CIBIL Score or SNV Trust Score for a new account.
 - Use explicit empty states such as "No application started", "No active loan", "CIBIL Score not checked" and "SNV Trust Score not generated". Do not use artificial zero values.
 - Create separate dashboard designs for new, draft, submitted, offers received, active loan, multiple applications/loans, closed and restricted users.

- If an existing mobile number is detected during sign-up, route the person to sign-in instead of creating a duplicate account.

4.3 Loan selection and application shell

- Show all five loan products as available design journeys; remove the Sachet Loan coming-soon state.
- Each product card must carry the selected product into its own conditional application flow.
- Use the separate Loan Application Flow & Steps document as the only field-level source.
- Home Loan content must follow the finalized home-loan subtypes. Do not treat repair/renovation as a generic Home Loan subtype where it belongs under Mortgage/LAP.
- Do not force full KYC before the borrower provides requirement, profile and income information. Place document KYC at the stage defined in the separate specification.

4.4 Action Centre and lender requests

Create a dedicated Action Centre with an unread/action badge. The same task must also appear inside the relevant Application Detail page.

- Aggregate additional-document requests, re-upload requests, missing fields, lender clarifications, co-applicant actions, consent requests, offer expiry, e-Sign/e-Mandate and repayment actions.
- Every request card must show application ID, requesting lender, request ID, required item, borrower-facing reason, request date, due date, accepted format, status and recipient visibility.
- Actions: enter information, capture by camera, upload, select from Document Vault, ask a question, save draft, review and submit, or decline/withdraw where allowed.
- Status path: New -> Opened -> Draft -> Submitted -> Received -> Under review -> Accepted / Re-upload requested / Closed.
- After submission, show a timestamped receipt and reference number.
- A response requested by one lender is shared only with that lender by default. Wider reuse requires separate borrower consent.
- An assigned agent may help prepare a response; the borrower approves the final sensitive-data submission.

4.5 CIBIL Score

- Use a dedicated sidebar page labelled CIBIL Score, not a combined generic Scores page.
- States: Not checked, consent required, identity details required, checking, available, NA/NH, refresh required, failed, report disputed and temporarily unavailable.
- Display score/range, last checked, freshness, explanation, available factors, View Report, Check/Refresh and dispute guidance.

- Only display the CIBIL name when the data comes through an authorised TransUnion CIBIL arrangement. Show the actual source if another bureau is used.
- Differentiate a consumer self-check from a lender enquiry. Do not promise that a dashboard score replaces the lender's own enquiry.

4.6 SNV Trust Score

- Use a separate sidebar page labelled SNV Trust Score.
- States: Not generated, data required, consent required, bank data required, processing, available, insufficient data, recalculation required, failed and consent withdrawn.
- Display score/band, last calculated, source-data freshness, top contributing factors, improvement guidance and Recalculate action.
- Always describe the score as advisory. The regulated lender makes the final credit decision.
- Reuse a current score only when its source data remains valid. Before application submission, name the recipient lenders, purpose and data being shared.

4.7 Find a Loan Agent

1. Borrower selects Find a Loan Agent and reviews the assistance/safety explanation.
 2. Borrower submits loan product, amount band, help needed, language, PIN code/service area, preferred contact time and limited-data-sharing consent.
 3. The request is sent to eligible nearby verified agents.
 4. The first valid acceptance locks the assignment for that application/file.
 5. The borrower sees the assigned agent profile and may begin Secure Agent Chat or a masked call.
 6. Application/document access is granted separately and remains revocable.
- Assignment is application/file-level, not permanent borrower-level. Future applications may use another agent.
 - Reassignment is allowed at the borrower's request with a complete audit history. Preserve commission attribution according to the recorded file assignment and qualifying milestone.
 - States: Request submitted, searching, assigned, no agent available, area expanded, expired, cancelled, agent unavailable, reassignment requested and assistance completed.
 - Agent profile: name/photo, Verified by ShriNeo badge, agent ID, training status, service area, languages, availability and contact actions.
 - Use PIN code as the default location method. Precise device location is optional and consent-based.

4.8 Secure Agent Chat and masked calling

- Use the name "Secure Agent Chat" to distinguish the human conversation from Neo.
- Support text, delivery/read states, guided Document Vault sharing, upload progress, retry, status updates, report/block and end-assistance actions.
- Show a permanent warning never to share passwords, PINs, CVV or OTPs.
- Masked calling states: Call via ShriNeo, connecting, unavailable, ended, schedule callback and service unavailable. Never expose either real number.
- Do not show call recording by default. Any future recording requires a separate consent design.

4.9 Remaining borrower corrections

- Application Detail: overview, lender-wise status, requests, documents, offers, activity timeline and consent history.
- Offers: offered amount, tenure, APR, monthly repayment, total repayable, all charges/penal charges, validity, lender-specific KFS action and unmatched lender names. Do not preselect or visually push one lender.
- Documents: KYC via DigiLocker/camera/upload; bank statements via Account Aggregator/PDF; other documents via camera/upload. Use document-specific action labels.
- Find an Agent, Messages, Support and Profile must have working primary actions, not information-only tables.
- Profile: edit/verify contact details, language, individual consent management, sessions/devices, data download and account deactivation/deletion request.
- Payments: present lender-owned mandate/repayment details and route payment directly to the lender channel where applicable.
- Support: Call, Email, Raise Ticket, Track Complaint, Report Fraud and grievance escalation.

5. Agent Experience

5.1 Agent onboarding and activation

1. Language selection.
2. Mobile number and email verification.
3. Basic profile and service-area setup.
4. Agent KYC and liveness verification.
5. Independent sourcing-partner agreement, code of conduct and no-borrower-fee acknowledgement.
6. Bank/payout details with Skip for now.

7. Mandatory training with captions, transcript, language choice and resume progress.
 8. Knowledge assessment and policy acknowledgement.
 9. KYC/training/admin review status.
 10. Verified badge, training certificate, warm welcome and operational dashboard.
- Mandatory before operational access: KYC, training assessment and admin approval.
 - Bank details may be skipped. The dashboard may open after mandatory approval, but payouts remain locked until the bank account is verified. Show a persistent Complete payout setup banner.
 - The public badge appears only after mandatory checks and must say Verified by ShriNeo. The certificate is a ShriNeo Agent Training Certificate, not a regulatory licence.
 - If KYC enters manual review, permit training while the agent waits.
 - Before approval, show a restricted onboarding workspace with progress, pending items and support; do not show a broken or blank dashboard.
 - Training remains available after activation with Watch Again, history, certificate download, expiry and renewal modules.
 - Design KYC mismatch/re-upload, bank skipped/pending/failed, training not started/in progress/failed/passed, certificate expiring/expired and suspended states.

5.2 Nearby requests and assignment

- Add Nearby Requests / Assistance Requests as a primary module.
- Before acceptance, expose only loan type, amount band, help needed, language, service area and request age. Hide borrower identity, contact details and documents.
- Actions: Accept, Decline, View eligibility, and open the assigned borrower workspace after a successful lock.
- Support both platform-generated requests and the agent's own customer files. Label the sourcing origin clearly.

5.3 Assigned borrower workspace

- Show borrower/application summary, consent status, Secure Agent Chat, masked call, checklist, lender requests, timeline, drafts and borrower-approval checkpoints.
- The agent may assist and prepare drafts but cannot see OTPs, accept offers, e-Sign for the borrower, submit sensitive information without approval or collect money.
- Every access, upload, request and consent event requires a visible status and activity record.

5.4 Operational screens

- Make Leads and My Files rows interactive with View/Open, Contact, Follow-up, Upload/Request Document, status update and escalation paths.
- Commissions: earned/pending/paid/held/reversed, lender-confirmed disbursal reference, TDS, payout date, bank status, clawback reason and dispute/appeal.
- Training/resources: open modules, watch/download materials, assessment, certificate and renewal.
- Support: raise and track tickets; profile: coverage, security, bank setup and verification history.
- Use launch geography examples from Rajasthan, Uttar Pradesh, Gujarat and Delhi/NCR instead of the current MP-only examples.

6. Lender Experience

- Keep the current dashboard direction, risk indicators, masking concept, fixed decision-order messaging, API states and audit visibility.
- Convert all application/review tables from read-only displays into openable work queues with search, filters, assignment, pagination and saved views.
- Create a complete Application Detail with borrower/economic profile, loan requirement, loan-specific data, consents, documents, CIBIL, SNV Trust Score, requests, decisions, offers and activity history.
- PII remains masked by default. Unmasking requires a stated reason and produces an audit event.
- Additional Information Request: choose a field/document, write a borrower-facing reason, set a due date, keep internal notes separate, send, receive and accept/reject/re-request.
- Decision actions: assign/reassign, request information, manual review, approve, decline with mandatory reason and borrower-facing explanation.
- Offer/KFS: offered amount, tenure, APR, repayment, all charges, validity, KFS preview/issue, sanction, e-Sign/e-Mandate and disbursal status.
- Create full product/eligibility/routing/limit configuration, maker-checker approval, team/RBAC, billing/ledger, reports, API/webhook retry, incident and support flows.
- Fraud/high-risk/insufficient-data signals route to human review; do not design a silent automatic rejection.

7. Admin Experience

- Keep the executive dashboard, dependency status, operational queues, fraud watch, audit and system-monitoring visual direction.

- Create actionable Borrower, Agent, Lender, Loan and Fraud detail pages. Every oversight table needs Open/View and relevant workflow actions.
- Agent operations: KYC review, document re-request, training/assessment status, approve, badge/certificate issue, suspend, reinstate, conduct investigation and second approval.
- Lender operations: onboarding, integration status, product configuration, routing/limit management, team permissions and incident coordination.
- Loan oversight: complete timeline, lender responses, stuck-file intervention, document/query history and escalation.
- Fraud: linked applications/devices, evidence, manual review, lender notification, decision rationale and false-positive closure.
- Add a dedicated Complaints & Grievances queue with SLA, owner, conversation, escalation, resolution and RBI CMS guidance where applicable.
- Consent and data governance: purpose, source, recipient, granted/expiry, withdrawal, access history and deletion/retention status.
- SNV Trust Score oversight: model version, explainability, drift/fairness review, score history and override/audit trail.
- Complete commission/payout reconciliation, report scheduling, CMS create/edit/preview/approve/publish, user/RBAC and system-incident workflows.

8. Shared States, Responsive Design and Accessibility

8.1 State designs must change the entire journey

- Draft: resume/edit actions; never show submitted or lender-review content.
- Documents Required: show the exact request and completion action.
- Approved/Offer Received: show offer/KFS and next step, not review-in-progress copy.
- Rejected: show lender-specific neutral reason, next options and support; remove pending-offer language.
- Disbursal Initiated/Disbursed: show mandate/disbursal/loan servicing information and remove application-review actions.
- Closed: show closure letter, statements and historical records; remove active EMI/application actions.
- Offline/Stale/Partial: identify saved data, last updated time, disabled actions and retry/sync behavior.
- Restricted, Suspended and Archived must have different permissions, explanations, available actions and recovery paths.

- Apply the same principle to Agent verification/clawback, Lender integration/limit/API, and Admin fresh-tenant/fraud/incident states.

8.2 Responsive and accessible output

- Provide actual frames for approximately 1440 px desktop, 1024 px tablet/desktop, 768 px tablet and 390 px mobile. Prototype links must not simply open the same viewport.
- Use one semantic page title/H1 on every page, including all global error pages.
- Add Skip to main content and logical keyboard/focus order.
- Primary targets should be approximately 44 px on touch layouts.
- Replace repeated generic labels such as "View", "Upload", "Download", "Accept this offer" and "KFS" with contextual accessible names.
- Design focus, hover, disabled, loading, success and failure states for every interactive control.

8.3 Neo Assistant accessibility

- Give the full panel an accessible dialog/complementary role and name.
- Move focus into the panel when it opens, support Escape to close, trap focus as appropriate and restore focus after close.
- Remove the hidden launcher from keyboard focus while the panel is open.
- Announce listening, understanding, permission denied, device error and offline states through an accessible live region.
- Increase the voice-status dismiss control from 20 px to an accessible touch target.
- Avoid unsupported generic promises about disbursement speed, prepayment or lender terms; use lender/KFS-specific answers.

9. Canonical Prototype Data

Use one shared seed-data source across Borrower, Agent, Lender and Admin screens. Current examples conflict and must be normalised before handoff.

Area	Current conflict	Required instruction
Application	Personal loan appears as INR 3,00,000 / 36 months and INR 4,50,000 / 24 months.	Choose one scenario and reuse it everywhere.
Active loan	Dashboard shows IDFC FIRST Bank while Loans/Payments show Kaveri Bank with different EMI and balance.	Use one lender, loan ID, EMI, balance and due date across all screens.
Documents	Dashboard says verified while the Documents page still requires uploads.	Statuses and timelines must reflect the same document truth.

Area	Current conflict	Required instruction
Admin KPIs	Applications, agents, fraud cases and disbursal totals differ across dashboard/detail pages.	Use a single platform KPI dataset and reference date.

- Use a visible reference date for prototype data or relative dates that remain coherent.
- Never show an already-past date as "Next EMI" without an overdue state.
- Cross-role updates must reconcile: lender request -> borrower Action Centre -> agent workspace (if consented) -> lender response history -> admin audit.

10. Designer Deliverables and Acceptance Criteria

The design handoff is complete only when the following items are supplied.

- All existing screens updated according to this document, without redesigning locked/approved areas.
- All missing pages and role-detail workflows created.
- Desktop, tablet and mobile layouts for each major journey.
- Default, empty, loading, partial, action-required, success, failed, offline/stale, restricted and relevant role-specific states.
- Complete final copy, labels, helper text, warnings, validation content and confirmation messages.
- Clickable primary journeys with no dead table rows or placeholder-only buttons.
- Interaction notes for permissions, consent, file sharing, masked communication, role restrictions and cross-panel status syncing.
- A clearly named system-dependency note where an external service is required; do not label it as a future phase.
- Accessibility annotations for headings, focus order, keyboard behavior, accessible names, live regions and target sizes.
- A final consistency pass covering IDs, dates, amounts, lenders, statuses, terminology and reference data.

FINAL INSTRUCTION Retain the approved visual language. The work is to complete the platform, correct state/content inconsistencies and make every role journey actionable - not to redesign the product from scratch.
